

Response to Editor’s Quality Check Comments

Manuscript: “Real-Time Hallucination Correction in Vision-Language Models Using Dynamic Knowledge Graph Verification”

Dear Editor,

Thank you for the quality check of our submission. We have addressed both points raised, as detailed below. The changes made to the manuscript are also reflected in the editorial system Declaration step.

Comment 1. Data availability statement

We have added a Data Availability Statement to the “Declarations” section of the manuscript. Our study relies exclusively on publicly available benchmark datasets and does not generate any new dataset; the statement therefore identifies these public datasets, which are cited in the reference list. The statement now reads:

“Data availability: All datasets analysed during the current study are publicly available benchmark datasets obtained from their original public repositories, and are cited in this article: POPE, CHAIR (built on the MS-COCO dataset), MMHalBench, MedHallBench, InfoSeek, and KVQA. No new datasets were generated during the current study.”

On the editorial system, the data availability declaration has been updated from “No” to “Yes”, and the statement above has been provided accordingly.

Comment 2. Dual publication statement

The dual publication declaration has been updated to “No” on the editorial system. For completeness, we have also added a corresponding statement to the “Declarations” section of the manuscript:

“Competing interests: The authors declare that they have no competing interests. This manuscript is not a dual publication: it has not been published previously and is not under consideration for publication elsewhere.”

We believe these revisions fully address the quality check requirements and thank you for your consideration.

Sincerely,
The Authors
